

### 1 Introduction

The bobo croaker *P. elongatus* is assumed by CECAF as one single stock for Guinea-Bissau, Guinea, Sierra Leone and Liberia for assessment purposes. The consideration of one single stock for these 4 countries follows practical reasons and has no any biological basis.

### 2 Methods

Specimens pictures & otoliths (bi-annual)

Classification and multivariate analysis:

- Principal Component Analysis (PCA)
- Linear Discriminant Analysis (LDA)

#### Morphometry

Analysis based on morphometric measurements of the species (pictures) → TRUSS NETWORK

Analysis based on the otolith shape → FOURIER

#### Statistical analysis by country-zone

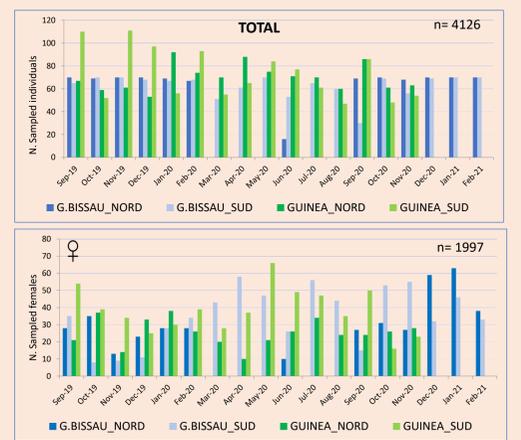

#### Life History Traits

Weight parameters

Reproduction parameters and features

Biological samplings (monthly)

- Length
- Sex
- Weight
- Gutted weight
- Gonad weight
- Maturity stage (1-5)
- Otoliths

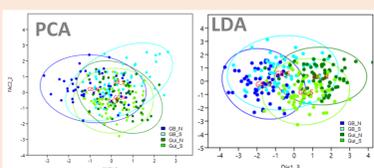

Parameters comparison by:

- ANCOVA (Kruskall- Wallys)
- ANOVA (Mahn-Whitney)/ (Kruskall- Wallys)

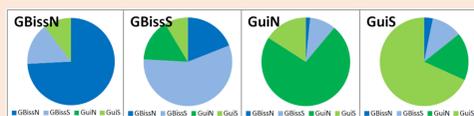

### 3 Results

#### Morphometry

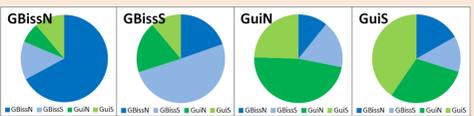

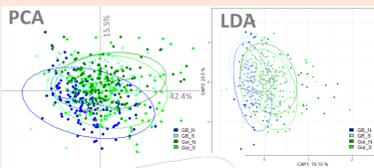

##### SPECIMEN SHAPE (TRUSS NETWORK)

Correct classification from LDA

##### OTOLITH SHAPE (FOURIER ANALYSIS)

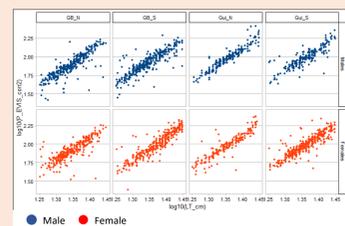

Similarity of the results of both morphometry methods. Based on the correct classification, comparison test, and PCA results: individuals from Guinea- Bissau could be distinguished from individuals from Guinea.

#### Life History Traits

##### WEIGHT PARAMETERS

Length- Gutted weight relationship

| Contry-Zone | Length- Gutted weight relationship |      | Le Cren's condition factor (k) |      |      |
|-------------|------------------------------------|------|--------------------------------|------|------|
|             | Slope (b)                          | SE   | median                         | mean | sd   |
| G. BISSAU_N | 2.80                               | 0.06 | 0.97                           | 0.96 | 0.17 |
| G. BISSAU_S | 2.93                               | 0.05 | 1.02                           | 1.01 | 0.13 |
| GUINEA-N    | 3.05                               | 0.06 | 1.06                           | 1.08 | 0.15 |
| GUINEA_S    | 2.85                               | 0.06 | 1.05                           | 1.07 | 0.16 |

No significant differences are observed in weight parameters among the four zones.

##### REPRODUCTION

|                 | FEMALES | G. BISSAU_N               | G. BISSAU_S          | GUINEA_N           | GUINEA_S             |
|-----------------|---------|---------------------------|----------------------|--------------------|----------------------|
| Spawning period |         | 6 of 7 months sampled     | All year             | All year           | All year             |
| Spawning peaks  |         | ..Jan-Feb.. (uncompleted) | March-April/ Jun-Jul | March-May/ Jul-Ago | March-April/ Jun-Ago |
| L50             |         | 19.0                      | 24.9                 | 16.8               | -                    |
| cv              |         | 0.59                      | 0.04                 | 0.85               | -                    |
| N               |         | 94                        | 183                  | 109                | -                    |

The species spawns throughout the year, with two main spawning peaks. Length at first maturity (L50) of females are not consistent between different countries-zones.

### 4 Conclusions (preliminary)

While data from life history traits do not show conclusive results, the two morphometric techniques (body shape-truss network and otolith shape) show more reliable information for stock identification. Following these techniques, two independent stocks of *Pseudotolithus elongatus* can be distinguished for Guinea-Bissau and Guinea. A more in-depth analysis of this information is being carried out and the results may be useful for fisheries assessment and management of this species.

The extension of this study to longer periods and to the southern areas considered as the same stock that Guinea Bissau-Guinea by CECAF (Sierra Leona and Liberia) is highly recommended.
